

FNP Sales Analysis Dashboard

Executive Summary | Interactive Sales & Occasion Performance Dashboard (Excel / Power BI)

TOTAL ORDERS	TOTAL REVENUE	AVG ORDER-DELIVERY TIME	AVG CUSTOMER SPEND
1,000	Rs. 5,86,176	5.53 days	Rs. 4,652.19

1. Project Overview

This project is an interactive **Sales Analysis Dashboard** built for FNP (Ferns N Petals), designed to track and visualize gifting and floral e-commerce sales performance across occasions, product categories, cities, and time periods. The dashboard consolidates raw transactional data into a single, filterable view that lets stakeholders monitor revenue, delivery performance, and customer spending patterns at a glance, and drill down by Order Date, Delivery Date, and Occasion.

2. Objective

The dashboard was built to help business and operations teams:

- Track overall sales performance through key metrics such as total orders, revenue, delivery time, and customer spend.
- Identify which occasions (Anniversary, Birthday, Diwali, Holi, Raksha Bandhan, Valentine's Day) drive the most revenue.
- Understand product and category-level performance to guide inventory and marketing decisions.
- Analyze order timing patterns (by hour and by month) to optimize staffing, delivery slots, and campaigns.
- Identify top-performing cities to support regional/logistics planning.
- Enable self-service, filter-driven exploration of the data without needing to query the raw dataset.

3. Tools & Methodology

The dashboard was developed using Excel/Power BI-style interactive charts and slicers. Raw order-level data (order date, delivery date, occasion, category, product, city, revenue) was cleaned and modeled, then visualized using column charts, line charts, and interactive slicers for Order Date, Delivery Date, and Occasion, allowing dynamic filtering of every visual on the page.

- **Data preparation:** cleaning and structuring transactional order data.
- **Data modeling:** deriving KPIs (total orders, revenue, delivery time, average spend).
- **Visualization:** column charts, line/trend charts, and cross-filtering slicers.
- **Interactivity:** Occasion, Order Date, and Delivery Date filters that update all visuals simultaneously.

4. Key Performance Indicators

Metric	Value	Interpretation
Total Orders	1,000	Total number of orders placed in the selected period.
Total Revenue	Rs. 5,86,176.00	Aggregate revenue generated across all occasions and categories.
Avg. Order-to-Delivery Time	5.53 days	Average time taken to fulfill and deliver an order.
Avg. Customer Spend	Rs. 4,652.19	Average revenue generated per customer/order.

5. Dashboard Components

5.1 Revenue by Occasions

A column chart breaking down revenue across occasions - Anniversary, Birthday, Diwali, Holi, Raksha Bandhan, and Valentine's Day - alongside an 'All Occasions' aggregate. Anniversary purchases stand out as one of the strongest revenue contributors, followed by Holi and Diwali, while Raksha Bandhan trails behind, indicating opportunity for targeted campaigns during that period.

5.2 Revenue by Category

Shows revenue split across five product categories: Colors, Mugs, Raksha Bandhan, Soft Toys, and Sweets. **Soft Toys** is the clear category leader by a wide margin, followed by Sweets, while Mugs generates the least revenue - useful for prioritizing catalog and inventory investment.

5.3 Revenue by Hour (Order Time)

A line chart of revenue across the 24-hour order cycle. Revenue shows sharp, repeated peaks around the early morning and late-evening hours, suggesting customers place high-value orders in bursts rather than steadily throughout the day - valuable for scheduling flash promotions and support staffing.

5.4 Revenue by Months

A trend line showing revenue growth over the year, with a clear upward trajectory in the later months. This indicates strengthening sales momentum and seasonal demand building toward year-end, useful for forecasting and inventory planning ahead of peak gifting seasons.

5.5 Top 5 Products by Revenue

Ranks the five highest-revenue-generating products. The leading product contributes noticeably more revenue than the others, making it a strong candidate for continued promotion, stock prioritization, and cross-sell bundling.

5.6 Top 10 Cities by Orders

Highlights the ten cities generating the most orders, led by one standout city with roughly twice the order volume of the next closest markets. This points to concentrated regional demand that could guide targeted logistics, warehousing, and localized marketing decisions.

5.7 Interactive Filters (Slicers)

Three slicers - **Order Date**, **Delivery Date**, and **Occasion** - let users filter the entire dashboard dynamically, enabling focused analysis (e.g., viewing only Diwali orders, or only orders placed in a specific month) without altering the underlying data.

6. Key Insights

- **Occasion-driven demand:** Anniversary, Holi, and Diwali are the top revenue-driving occasions, together contributing a large share of total sales.
- **Category concentration:** Soft Toys dominate category-level revenue, indicating strong customer preference and repeat demand for this segment.
- **Order timing patterns:** Revenue spikes at specific hours rather than being evenly distributed, suggesting opportunities for time-targeted offers.
- **Positive growth trend:** Monthly revenue shows consistent upward momentum, reflecting healthy business growth.
- **Geographic concentration:** Order volume is skewed toward a small set of top cities, led by one dominant market.
- **Delivery performance:** An average delivery time of 5.53 days is a useful baseline metric to track and improve for customer satisfaction.

7. Recommendations

- Increase marketing spend and inventory for high-performing occasions (Anniversary, Holi, Diwali) ahead of their seasonal peaks.
- Expand the Soft Toys and Sweets product lines given their strong revenue contribution, while reviewing underperforming categories like Mugs.
- Schedule promotions and customer support around peak order-time windows identified in the hourly trend chart.
- Prioritize logistics and warehousing capacity in top-performing cities to sustain service levels as order volume grows.
- Investigate and work to reduce the average order-to-delivery time to improve customer experience and retention.
- Use the Occasion/Date slicers to run recurring, occasion-specific performance reviews (e.g., a Raksha Bandhan post-mortem) to replicate successes across weaker occasions.

8. Conclusion

The FNP Sales Analysis dashboard provides a consolidated, interactive view of sales performance across occasions, categories, products, cities, and time. With 1,000 orders analyzed and Rs. 5,86,176 in total revenue, the dashboard surfaces clear, actionable patterns - from occasion and category concentration to peak ordering hours and top-performing cities - that can directly inform marketing, inventory, and logistics decisions. Its filter-driven design makes it a reusable tool for ongoing, self-service performance monitoring rather than a one-time analysis.
